UNIVERSITY

The patent system's premise and how inventor incentives undermine it

- Substantial support for innovation $\leftrightarrow$ knowledge disclosure

The patent system's premise and how inventor incentives undermine it

- Substantial support for innovation $\leftrightarrow$ knowledge disclosure
 - A crack in the bargain: clear disclosure has real costs
 - Accelerates imitation
 - Increases infringement due to clearer patent scope
- ⇒ Firms hide knowledge by writing opaque patents (“**obfuscation**”)

The patent system's premise and how inventor incentives undermine it

- Substantial support for innovation $\leftrightarrow$ knowledge disclosure
- A crack in the bargain: clear disclosure has real costs
 - Accelerates imitation
 - Increases infringement due to clearer patent scope $\Rightarrow$ Firms hide knowledge by writing opaque patents (“**obfuscation**”)
- We ask:
 1. Can we measure obfuscation? (**Yes.**)
 2. What disciplines the incentive to obfuscate? $\Rightarrow$ **Reliance on external financing plays a central role**

The paper in a slide

- **Key innovation:** LLM counterfactual decomposes patent complexity
 - $\text{Obfuscation} = \text{Total Complexity} - \text{Fundamental Complexity (LLM rewrite)}$
Validation: $\uparrow$ in information asymmetry, $\downarrow$ in trade secrets

The paper in a slide

- **Key innovation:** LLM counterfactual decomposes patent complexity
 - $\text{Obfuscation} = \text{Total Complexity} - \text{Fundamental Complexity (LLM rewrite)}$
Validation: $\uparrow$ in information asymmetry, $\downarrow$ in trade secrets
 - Approach applicable in many disclosure settings

- **Key innovation:** LLM counterfactual decomposes patent complexity
 - $\text{Obfuscation} = \text{Total Complexity} - \text{Fundamental Complexity (LLM rewrite)}$
Validation: $\uparrow$ in information asymmetry, $\downarrow$ in trade secrets
 - Approach applicable in many disclosure settings
- **Uncover strategic vs. financing tradeoff:**
 - Obfuscation deters rivals and reduces citations but reduces financing capacity
Identification: Clarity (§112) strictness of patent examiner (IV, Dyer et al. 2024)

- **Key innovation:** LLM counterfactual decomposes patent complexity
 - Obfuscation = Total Complexity – Fundamental Complexity (*LLM rewrite*)
Validation: ↑ in information asymmetry, ↓ in trade secrets
 - Approach applicable in many disclosure settings
- **Uncover strategic vs. financing tradeoff:**
 - Obfuscation deters rivals and reduces citations but reduces financing capacity
Identification: Clarity (§112) strictness of patent examiner (IV, Dyer et al. 2024)
 - Obfuscation responds to clarity/disclosure shocks, but mediated by financing needs
Identification: Nautilus v. Biosig (2014); AIPA (1999)

- **Key innovation:** LLM counterfactual decomposes patent complexity
 - Obfuscation = Total Complexity – Fundamental Complexity (*LLM rewrite*)
Validation: ↑ in information asymmetry, ↓ in trade secrets
 - Approach applicable in many disclosure settings
- **Uncover strategic vs. financing tradeoff:**
 - Obfuscation deters rivals and reduces citations but reduces financing capacity
Identification: Clarity (§112) strictness of patent examiner (IV, Dyer et al. 2024)
 - Obfuscation responds to clarity/disclosure shocks, but mediated by financing needs
Identification: Nautilus v. Biosig (2014); AIPA (1999)
 - Easing financial constraints increases obfuscation
Identification: Moody's 2006 pension liability adjustment

- **Key innovation:** LLM counterfactual decomposes patent complexity
 - Obfuscation = Total Complexity – Fundamental Complexity (*LLM rewrite*)
Validation: ↑ in information asymmetry, ↓ in trade secrets
 - Approach applicable in many disclosure settings
- **Uncover strategic vs. financing tradeoff:**
 - Obfuscation deters rivals and reduces citations but reduces financing capacity
Identification: Clarity (§112) strictness of patent examiner (IV, Dyer et al. 2024)
 - Obfuscation responds to clarity/disclosure shocks, but mediated by financing needs
Identification: Nautilus v. Biosig (2014); AIPA (1999)
 - Easing financial constraints increases obfuscation
Identification: Moody's 2006 pension liability adjustment

⇒ **A new channel for financing to shape the trajectory of innovation**

We decompose complexity into fundamental and strategic components

- Problem: Some technologies are genuinely harder to describe
- Solution: Use an LLM (Sonnet 3.5) to construct a counterfactual abstract
Give me a simpler and clearer version of this patent abstract. *Reply with JUST your version, not any label, title, header, or comments.*
- Scale: 2.6M patents matched to public firms, 1976–2023
- Measurement: For any linguistic complexity measure $f(\cdot)$:

$$\begin{aligned}\text{Obfuscation} &= f(\text{Original abstract}) - f(\text{LLM rewrite}) \\ &= \text{Total Complexity} - \text{Fundamental Complexity}\end{aligned}$$

Appendix: [Meaning preservation] and [LLM output stability]

IBM Patent 9547842: 7 grade levels of additional complexity

As filed:

A method, a system and a computer program product of transmitting availability information in an electronic mail system are disclosed. The system includes a first system including a sender, the first system is adapted to activate an availability indicator having a start date, wherein the activation is performed by the sender and extract availability indicator metadata from the availability indicator. ...

IBM Patent 9547842: 7 grade levels of additional complexity

As filed:

A method, a system and a computer program product of transmitting availability information in an electronic mail system are disclosed. The system includes a first system including a sender, the first system is adapted to activate an availability indicator having a start date, wherein the activation is performed by the sender and extract availability indicator metadata from the availability indicator. ...

LLM rewrite:

This invention describes a way to share availability information through email. It involves a system where a sender can set up an availability indicator with start and end dates, along with a message. When the sender emails someone for the first time after setting this up, and before the start date, the system automatically adds the availability information to the email. The system also includes a scheduling feature that helps create these availability indicators.

Descriptive Facts

Validation: Information asymmetry is higher following obfuscated grants

	Info Asymmetry Percentile			Trade Secret (Boolx100)		
	(1)	(2)	(3)	(4)	(5)	(6)
Obfuscation (GF) (z)	0.423*** (0.09)	0.658*** (0.17)	0.410*** (0.09)	-0.338** (0.15)	-0.671** (0.33)	-0.320** (0.16)
Total Complexity (GF) (z)		-0.245 (0.18)			0.348 (0.36)	
Fundamental Complexity (GF) (z)			-0.060 (0.04)			0.085 (0.09)
Fixed effects:						
CPC-year	Yes	Yes	Yes	Yes	Yes	Yes
Obs.	1,802,286	1,802,286	1,802,286	1,455,104	1,455,104	1,455,104
R^2	0.49	0.49	0.49	0.27	0.27	0.27

- Validation a la Bushee et al. (2018), using Amihud (2002) illiquidity
- Obfuscation is stronger signal than total patent complexity

Obfuscation is a form of IP protection

	Info Asymmetry Percentile			Trade Secret (Boolx100)		
	(1)	(2)	(3)	(4)	(5)	(6)
Obfuscation (GF) (z)	0.423*** (0.09)	0.658*** (0.17)	0.410*** (0.09)	-0.338** (0.15)	-0.671** (0.33)	-0.320** (0.16)
Total Complexity (GF) (z)		-0.245 (0.18)			0.348 (0.36)	
Fundamental Complexity (GF) (z)			-0.060 (0.04)			0.085 (0.09)
Fixed effects:						
CPC-year	Yes	Yes	Yes	Yes	Yes	Yes
Obs.	1,802,286	1,802,286	1,802,286	1,455,104	1,455,104	1,455,104
R^2	0.49	0.49	0.49	0.27	0.27	0.27

- 1 s.d. $\rightarrow$ 0.34p.p. less likely to discuss trade secrets (Glaeser (2018)) in 10-K
- Suggests that obfuscation substitutes for trade secrets

Competitive factors as determinants of obfuscation

- Rises when facing threats from dominant industry leaders

Competitive factors as determinants of obfuscation

- Rises when facing threats from dominant industry leaders
- Rises when the firm has a larger market share to defend

Competitive factors as determinants of obfuscation

- Rises when facing threats from dominant industry leaders
- Rises when the firm has a larger market share to defend
- Falls after competitors develop more valuable patents

When firms pledge patents as collateral, obfuscation falls

- Event study around a firm's **first patent pledge**
- Pledging makes financing value of patents salient
- Result: complexity falls, driven by obfuscation decline

First evidence of a **financial factor** disciplining the obfuscation decision

Four sources of identification

Four strategies to identify the strategic-financing tradeoff

- **Strategy 1: Examiner IV** random assignment of patent examiners
 - Some examiners enforce greater §112 clarity (Dyer et al. 2024)
- **Strategy 2: Nautilus v. Biosig (2014)** Supreme Court clarity mandate
 - Articulated a stronger uniform requirement for definiteness of claims (Ashtor 2022)
- **Strategy 3: AIPA (1999)** accelerated disclosure requirement
 - Patents filed after 2000 published 18 months after filing unless US-only (Ireland et al. 2024)
- **Strategy 4: Moody's pension adjustment (2006)** shock to financial constraints
 - Reduced adjusted leverage, positively shocked ratings (Kraft 2015; Kisgen 2019)

IV tests demonstrate strategic/financing tradeoff

- AIPA speeds up disclosure for patents also filed abroad
 - Exposure: % patents co-filed abroad pre-event
 - Ireland et al. (2024): → Total Complexity
- → Firms respond by increasing obfuscation
 - 10% of sample SD of obfuscation
- But less so for firms that pledged patents or rely on external finance

→ The cost of increasing obfuscation is higher for finance-dependent firms

Easing financial constraints unlocks more obfuscation

- Shock to **financial constraints**: Moody's 2006 pension adjustment
- ↑ credit-rating of firms with large underfunded pensions (Kraft 2015; Kisgen 2019)

Easing financial constraints unlocks more obfuscation

- Shock to **financial constraints**: Moody's 2006 pension adjustment
- ↑ credit-rating of firms with large underfunded pensions (Kraft 2015; Kisgen 2019)

Summary of tests

- **A firm's first pledge** — salience of patents' financing role increases
→ Obfuscation of subsequent patents falls

Summary of tests

- **A firm's first pledge** — salience of patents' financing role increases
 - Obfuscation of subsequent patents falls
- **Examiner IV** — lax examiners allow more obfuscation
 - Reduces patents' financing capacity (sales and collateralization)

Summary of tests

- **A firm's first pledge** — salience of patents' financing role increases
 - Obfuscation of subsequent patents falls
- **Examiner IV** — lax examiners allow more obfuscation
 - Reduces patents' financing capacity (sales and collateralization)
- **Nautilus v. Biosig (2014)** — clarity mandate
 - Obfuscation falls, but not for financially dependent firms already emphasizing clarity

Summary of tests

- **A firm's first pledge** — salience of patents' financing role increases
 - Obfuscation of subsequent patents falls
- **Examiner IV** — lax examiners allow more obfuscation
 - Reduces patents' financing capacity (sales and collateralization)
- **Nautilus v. Biosig (2014)** — clarity mandate
 - Obfuscation falls, but not for financially dependent firms already emphasizing clarity
- **AIPA (1999)** — accelerated disclosure
 - Obfuscation increases, but dampened for financially dependent firms
